

REPORT

Vriddhi Agrawal (IMT2023611),

Arismita Mukherjee (IMT2023585)

Our code first truncates a number entered by the user (may be decimal or not decimal), and then calculates the sum of squares of digits of the number obtained after truncating the original number.

Input Format:

The user has to input instructions in Assembly Language. The program continues to take instructions until the input is "EXIT". After taking the instructions, the assembler displays the corresponding Machine Language Program. The user can then input their desired number.

Assembly Code:

LOAD M(0) TRUN

STOR M(0)

// The below instructions are in a loop

LOAD M(0) DIVI M(1)

POWR M(2) ADDD M(3)

STOR M(3)

LOAD (MQ) STOR M(0)

JUMP M(252, 0:19)

EXIT

New Instructions:

- TRUN : Stands for Truncate. Truncates the content of the accumulator (overwrites the accumulator with the truncated value of the original number). Opcode = 00100011.
- POWR M(X) : Stands for Power. Calculates AC raised to the power of M(X), i.e., $AC^{M(X)}$, and stores the result in AC. Opcode = 00100010.

Output:

```
Enter instructions:
LOAD M(0) TRUN
STOR M(0)
LOAD M(0) DIVI M(1)
POWR M(2) ADDD M(3)
STOR M(3)
LOAD (MQ) STOR M(0)
JUMP M(252, 0:19)
EXIT
```

```
Machine Language Program:
000000010000000000000001000110000000000000
0000000000000000000000010000100000000000
